WELL CONSTRUCTION AND TEST REPORT

CITY OF GILLETTE

MADISON PIPELINE PROJECT: TEST WELL #2 & #2A

FUTURE COG MADISON PRODUCTION WELL M-12

MUNICIPAL WATER SUPPLY

WELL PERMIT NO. U.W. 195672

CITY OF GILLETTE PROJECT NUMBER

07EN58 - CONTRACT #1

JULY 2013

Prepared by:

Burns & McDonnell
9785 Maroon Circle, Suite 400

Gillette, WY 82717-3003
PREFACE

The Gillette Madison Pipeline Project was funded by the State of Wyoming with a local match from Campbell County. State funds were administered by the Wyoming Water Development Commission with construction sponsored by the City of Gillette.

Civil engineering design services were provided by Burns & McDonnell as lead consultant with hydrogeologic services and other engineering design services provided by Morrison-Maierle, Inc. as a subconsultant.

Burns & McDonnell provided consulting services from their office in Centennial, CO.

Morrison-Maierle, Inc. provided engineering design and construction management services from their office in Gillette, WY with contract administration and engineering support from their Billings, MT office. Morrison-Maierle, Inc. geologic services were provided from their offices in Helena and Bozeman, Montana.

The City of Gillette Test Well #2 site was one of two test well sites selected for initial testing of potential yield and water quality from the Madison aquifer in a new area, outside of the existing City of Gillette Madison Well Field that has been in operation since the early 1980s.
# Table of Contents

1 INTRODUCTION........................................................................................................1
  1.1 Test Well #2 .....................................................................................................1
  1.2 Test Well #2A ..................................................................................................3
  1.3 Permits and Certificate of Survey ....................................................................3
  1.4 Consultants, Contractors and Support Services ..............................................6
  1.5 Start and Completion Dates ............................................................................7

2 GEOLOGY ....................................................................................................................7
  2.1 Hydrogeologic Framework ..............................................................................8
  2.2 Formation Tops ...............................................................................................11

3 CONSTRUCTION .......................................................................................................13
  3.1 Drilling Equipment ..........................................................................................13
      3.1.1 Draw Works .............................................................................................13
      3.1.2 Derrick .....................................................................................................14
      3.1.3 Power Unit .............................................................................................14
      3.1.4 Support Equipment ...............................................................................14
      3.1.5 Air Package ...........................................................................................15
  3.2 Drilling Methods ...............................................................................................17
      3.2.1 Flooded Reverse Method .......................................................................17
      3.2.2 Direct Air Rotary Method .....................................................................19
  3.3 Drilling Fluids ...................................................................................................20

3.4 Construction History ..........................................................................................21
  3.4.1 Road Construction ......................................................................................21
  3.4.2 Test Well #2 ..............................................................................................22
      3.4.2.1 36-Inch Surface Conduit ..................................................................22
      3.4.2.2 24-Inch Surface Casing ...................................................................23
      3.4.2.3 16-Inch Pumping Chamber (Abandoned) .........................................25
  3.4.3 Test Well #2A .............................................................................................33
      3.4.3.1 36-Inch Surface Conduit ..................................................................33
      3.4.3.2 24-Inch Surface Casing ...................................................................33
      3.4.3.3 Test Well #2A 16-Inch Pumping Chamber .......................................41
      3.4.3.4 10-3/4 Inch Casing to Top of Madison ............................................44
3.4.3.5 9-7/8 Inch Open Hole in Madison Aquifer ........................................50
3.4.3.5.1 Air Rotary Drilling .................................................................50
3.4.3.5.2 Air Lift Discharge Rate .........................................................60
3.4.3.6 Identification of Bottom of Madison Aquifer Strata ......................62
3.5 Borehole, Casing and Cement Summary ...........................................69
3.6 Plumbness and Alignment .................................................................70

4 DEVELOPMENT BY HYDRAULIC FRACTURING WITH ACID. ..........77
4.1 Acid-Fracturing Equipment ...............................................................77
4.2 Hydraulic Fracturing with Acid .........................................................78
4.3 Post-Acid Treatment Water Quality ..................................................86
4.4 Result of Stimulation .................................................................87

5 YIELD AND DRAWDOWN TESTS ..................................................98
5.1 Pre-Test Monitoring .................................................................98
5.2 Test Pump Equipment .................................................................102
  5.2.1 ESP TP1700 8-Stage Pump Curves .............................................102
  5.2.2 ESP TP1700 Performance .........................................................103
